Attack vs. Defense

Adversarial Examples Are Not Easily Detected: Bypassing Ten Detection Methods

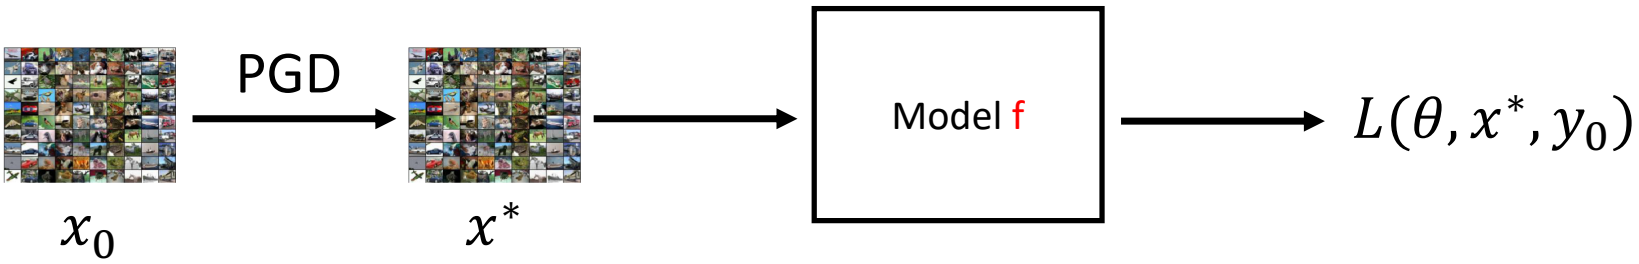
Nicholas Carlini David Wagner
University of California, Berkeley

Obfuscated Gradients Give a False Sense of Security: Circumventing Defenses to Adversarial Examples

Anish Athalye [*1] **Nicholas Carlini** [*2] **David Wagner** [2]

Adversarial Training

Madry's adversarial training



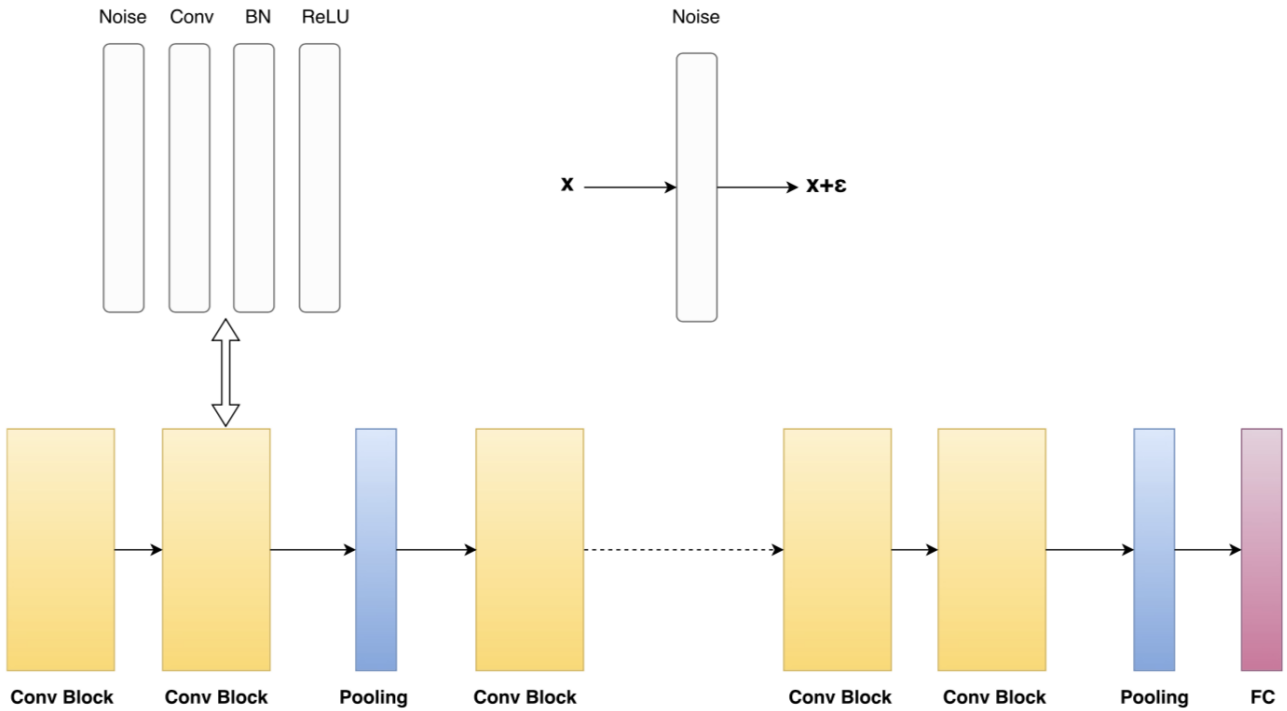
- **Madry's adversarial training:** Madry et al. (2018) proposed to incorporate the adversarial search inside the training process, by solving the following robust optimization problem:

$$\arg\min_{\boldsymbol{\theta}} \mathop{\mathbb{E}}_{(\boldsymbol{x},y)\sim\mathcal{D}} \left\{ \max_{\|\boldsymbol{\delta}\|_\infty \leq \epsilon} L(\boldsymbol{\theta}, \boldsymbol{x}+\boldsymbol{\delta}, y) \right\}$$

Madry et al. *Towards Deep Learning Models Resistant to Adversarial Attacks.* ICLR, 2018.

Randomization

Random Self-Ensemble



- **Random Self-Ensemble:** Liu et al. proposed a "noise layer", which fuses output of each layer with Gaussian noise.

Liu et al. *Towards Robust Neural Networks via Random Self-ensemble.* ECCV, 2018.

Projection

Embedding Regularized Classifier (ER-Classifier)

Observation 1

Levina et al., 2005: The only reason any methods work in very high dimensions is that, in fact, the data are not truly high-dimensional.

Observation 2

Tanay et al., 2016: Adversarial samples do not lie on the data manifold.

- How to use the two findings to improve robustness of Deep Neural Network?

Li et al. *Towards Robustness of Deep Neural Networks via Regularization.* ICCV, 2021.

Deep Classifier: Framework

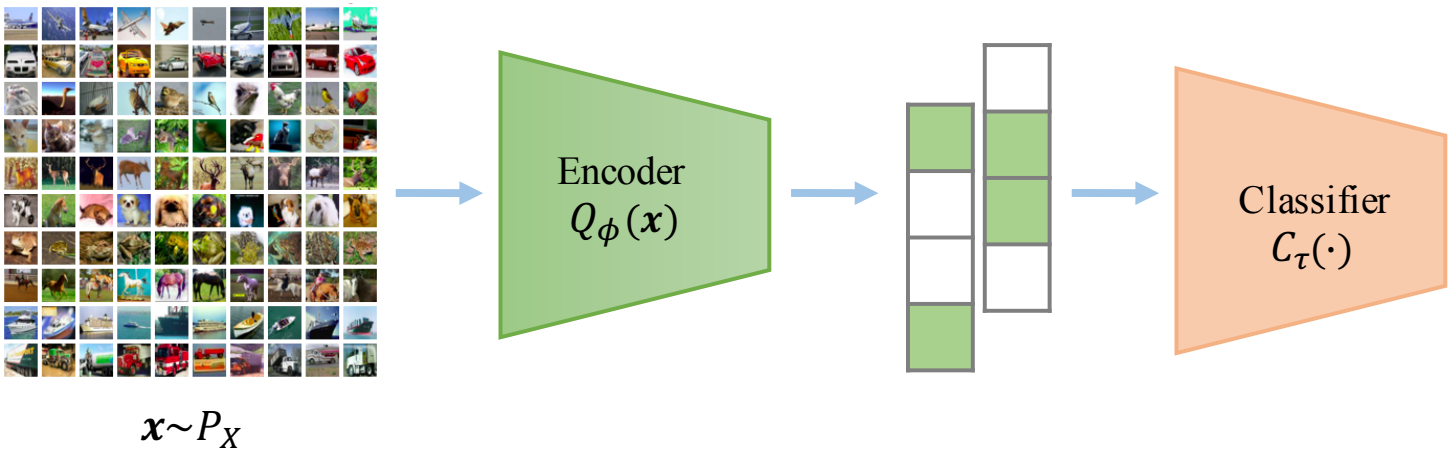


Figure: Deep Classifier

- P_X: Data distribution
- $\boldsymbol{Q}_\varphi$: Encoder (neural network)
- $\boldsymbol{C}_\tau$: Classifier (neural network)

ER-Classifier: Framework

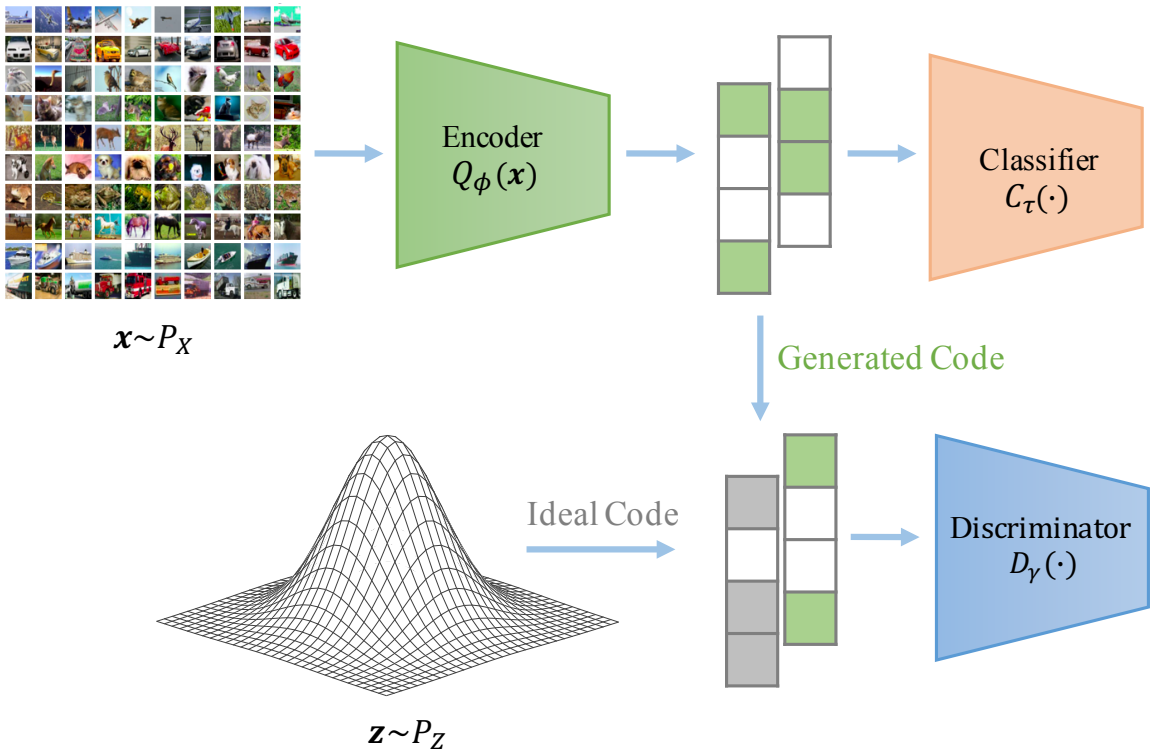

Figure: Embedding Regularized Classifier

- P_Z: Prior distribution
- $\boldsymbol{D}_\gamma$: Discriminator (neural network)
  (discriminator $\boldsymbol{D}$ used to separate "true" $\boldsymbol{z} \sim P_Z$ and "fake" $\tilde{\boldsymbol{z}} \sim \boldsymbol{Q}_Z$)

ER-Classifier: Objective Function

Minimize:

$$\mathbb{E}_{P_X}\mathbb{E}_{\boldsymbol{Q}(\boldsymbol{z}|\boldsymbol{x})}\left[\ell(y, \boldsymbol{C}(\boldsymbol{z}))\right] + \lambda\mathcal{D}(\boldsymbol{Q}_Z, P_Z) \tag{1}$$

Notations:

- $\boldsymbol{Q}(\boldsymbol{z}|\boldsymbol{x})$: encoder, projecting $\boldsymbol{x} \sim P_X$ to embedding vector $\boldsymbol{z}$
- $\boldsymbol{C}(\cdot)$: classifier, taking $\boldsymbol{z}$ as input and performing prediction
- ℓ: classification loss function
- y: label of $\boldsymbol{x}$

ER-Classifier: Objective Function

Minimize:

$$\mathbb{E}_{P_X}\mathbb{E}_{\boldsymbol{Q}(\boldsymbol{z}|\boldsymbol{x})}\left[\ell(y, \boldsymbol{C}(\boldsymbol{z}))\right] + \lambda\mathcal{D}(\boldsymbol{Q}_Z, P_Z) \tag{1}$$

Notations:

- $\boldsymbol{Q}(\boldsymbol{z}|\boldsymbol{x})$: encoder, projecting $\boldsymbol{x} \sim P_X$ to embedding vector $\boldsymbol{z}$
- $\boldsymbol{C}(\cdot)$: classifier, taking $\boldsymbol{z}$ as input and performing prediction
- ℓ: classification loss function
- y: label of $\boldsymbol{x}$

- $\boldsymbol{Q}_Z$: marginal distribution of $\boldsymbol{z}$ when $\boldsymbol{x} \sim P_X$ and $\boldsymbol{z} \sim \boldsymbol{Q}(\boldsymbol{z}|\boldsymbol{x})$.
- P_Z: prior distribution
- $\mathcal{D}$: arbitrary divergence between $\boldsymbol{Q}_Z$ and P_Z

  ER-Classifier: Combined with **adversarial training**, optimizing over adversarial examples

ER-Classifier: Methods Compared

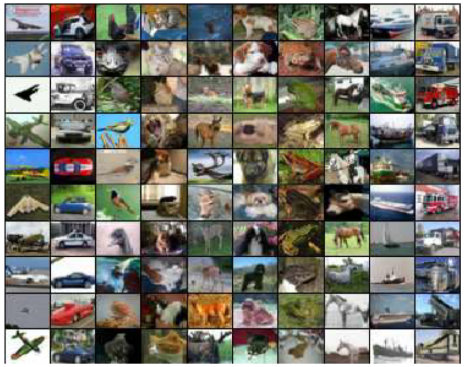
1. No defense: Models without any defense
2. ER-Classifier: ER-Classifier (with adversarial training)
3. ER-Classifier-: ER-Classifier without adversarial training
4. Madry's Adv: Madry's adversarial training
5. RSE: Random Self-ensemble.

Datasets

MNIST

28×28, 10

Train: 60,000; Test: 10,000



CIFAR10

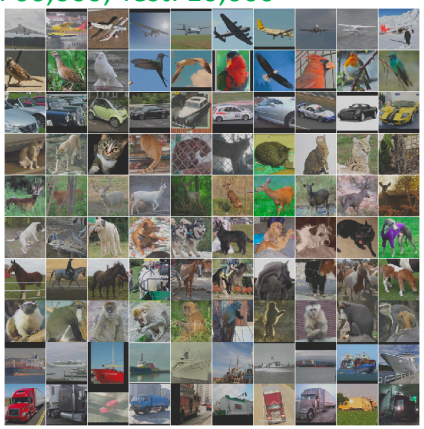
32×32, 10

Train: 50,000; Test: 10,000

ImageNet 143

64×64, 143

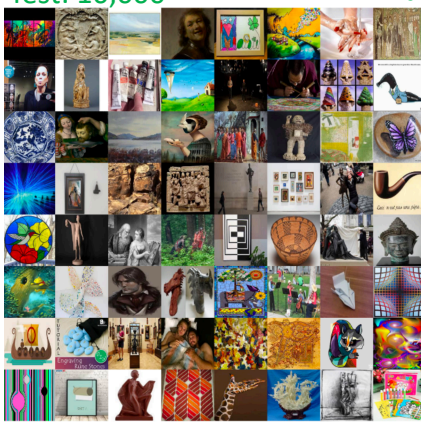
Train: 18,073; Test: 7,105



STL10

96×96, 10

Train: 5,000; Test: 8,000



Tiny ImageNet

64×64, 200

Train: 10,000; Test: 1,000

Experiment Results

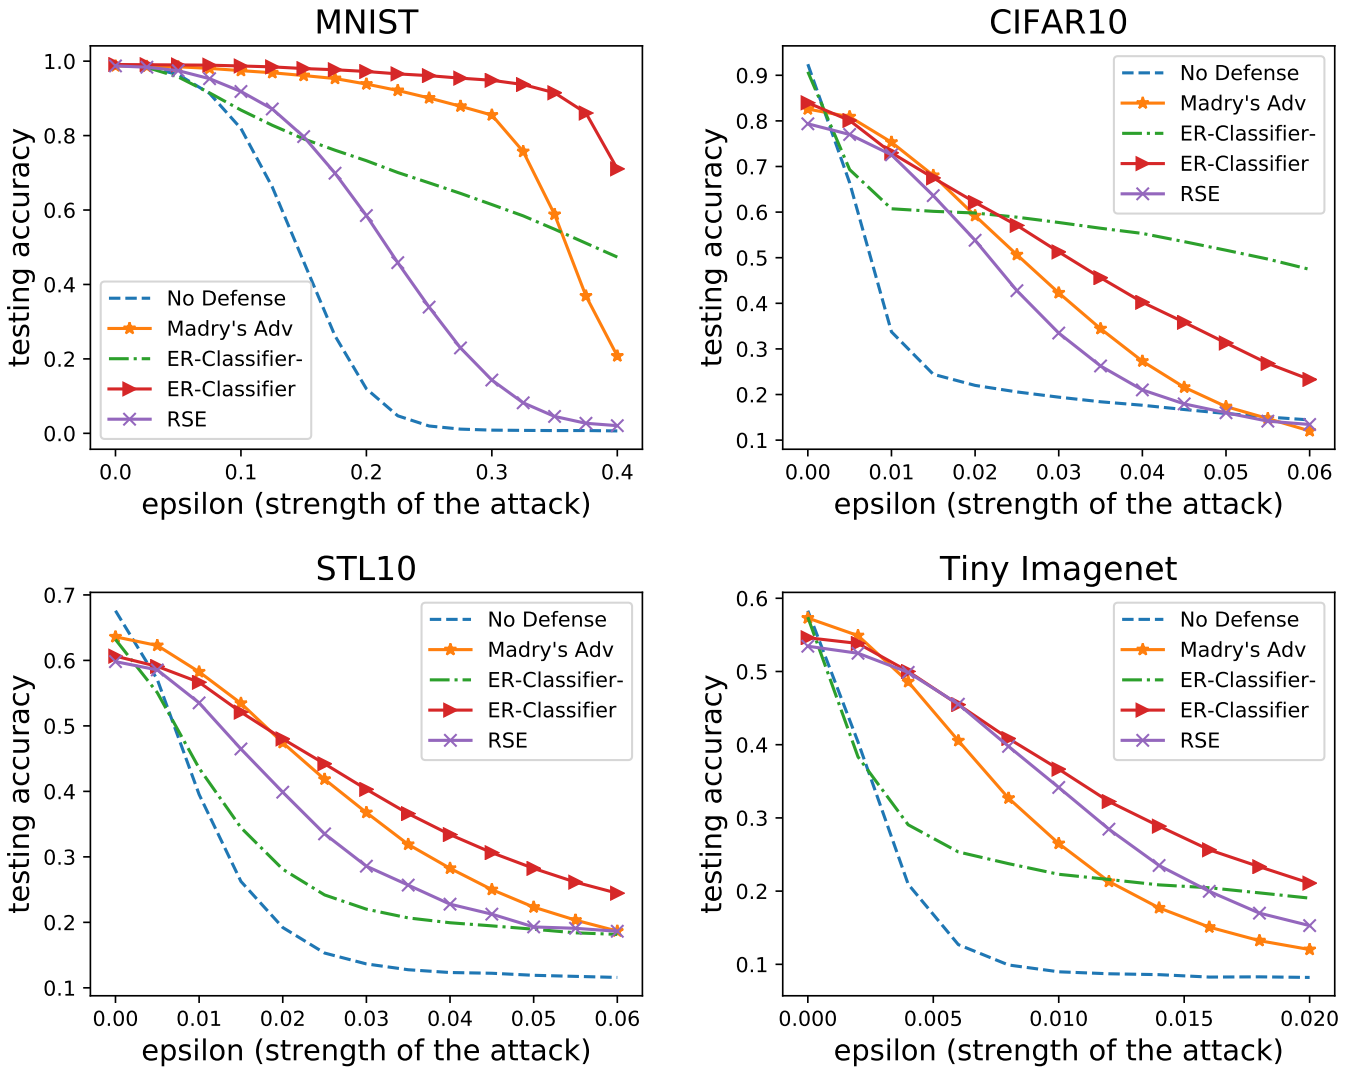


Figure: Testing accuracy under ℓ_∞-PGD attack on four different datasets.

Evaluate Discriminator

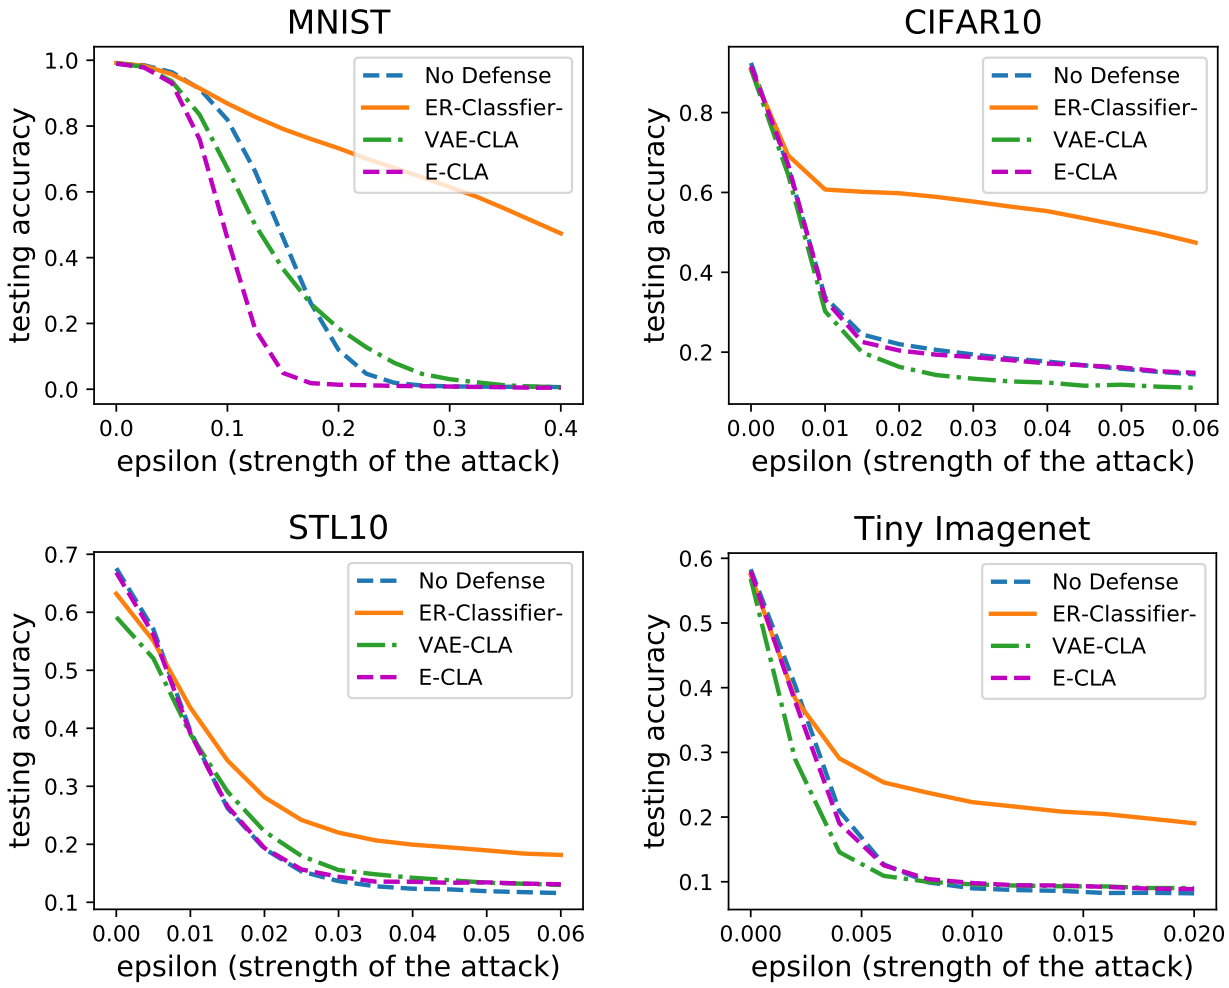

Figure: Testing accuracy of E-CLA, VAE-CLA and ER-Classsifier$^-$ under ℓ_∞-PGD attack on four different datasets: MNIST, CIFAR10, STL10 and Tiny Imagenet.

Embedding Visualization

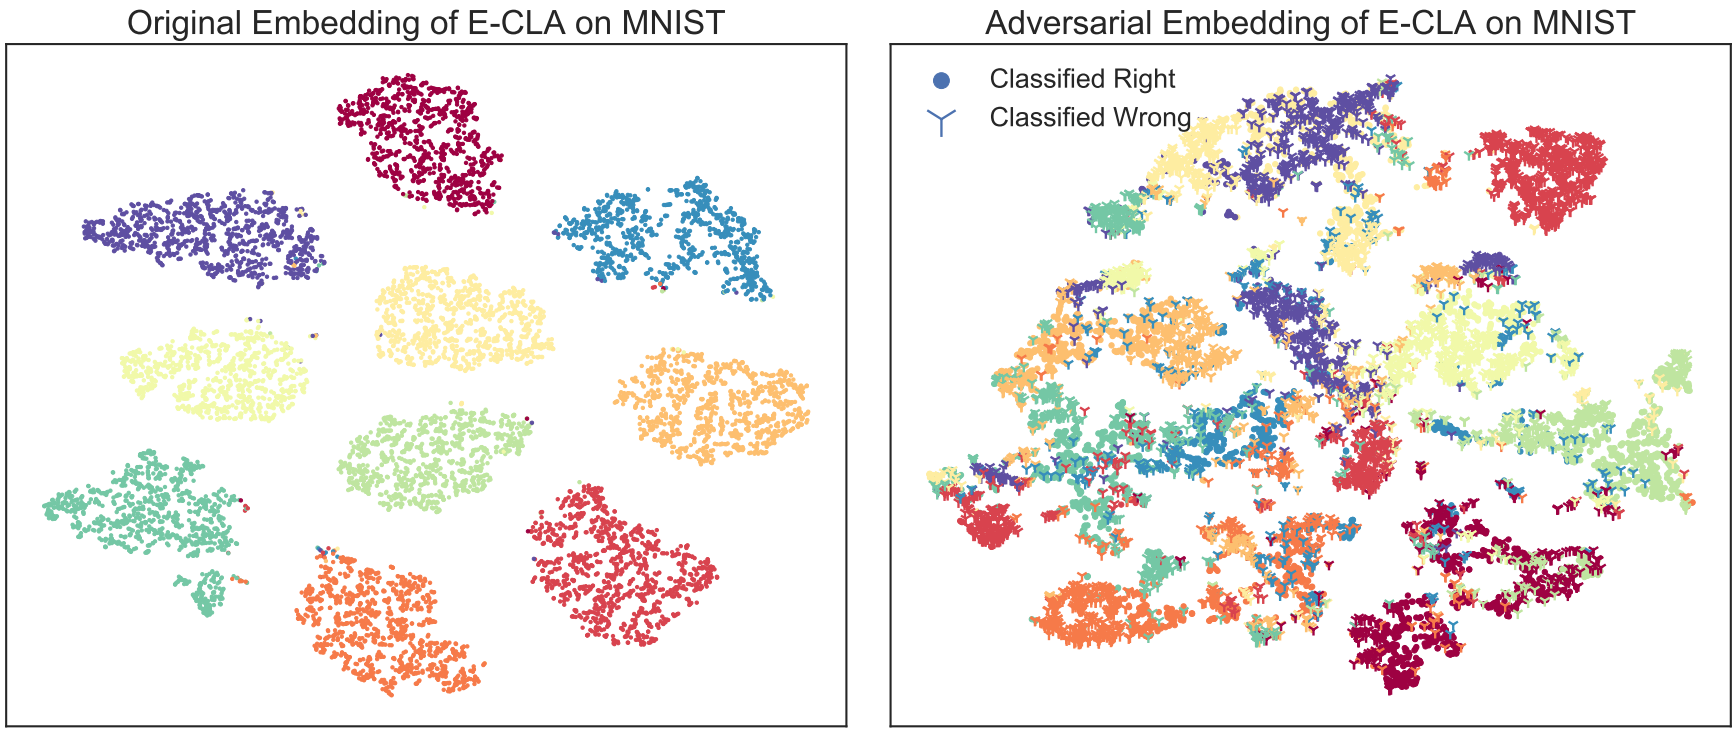

Figure: 2D embeddings for E-CLA on MNIST.

Embedding Visualization

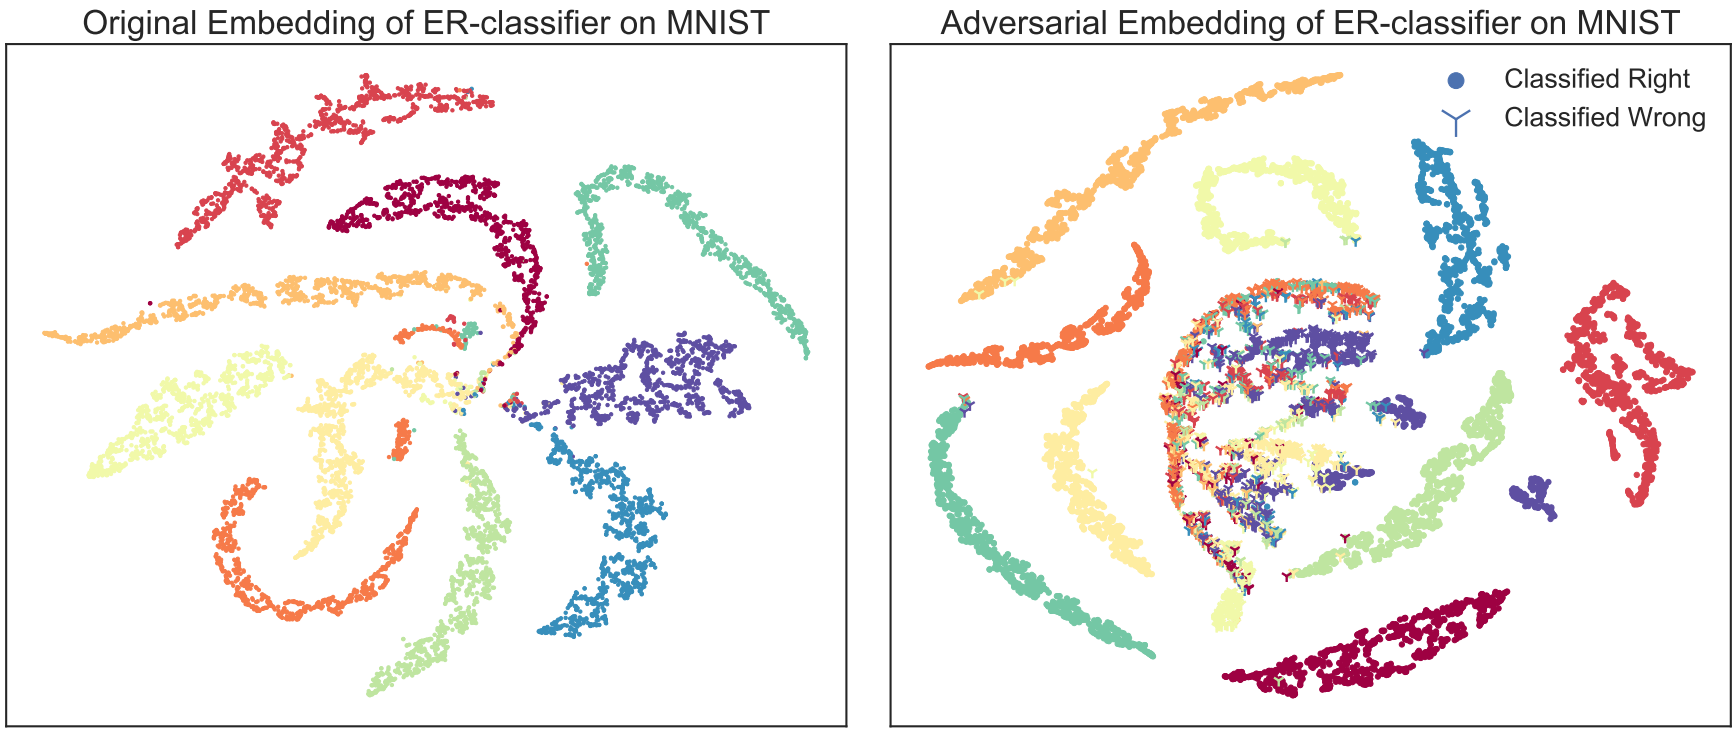

Figure: 2D embeddings for ER-Classifier on MNIST.

Dimension Selection

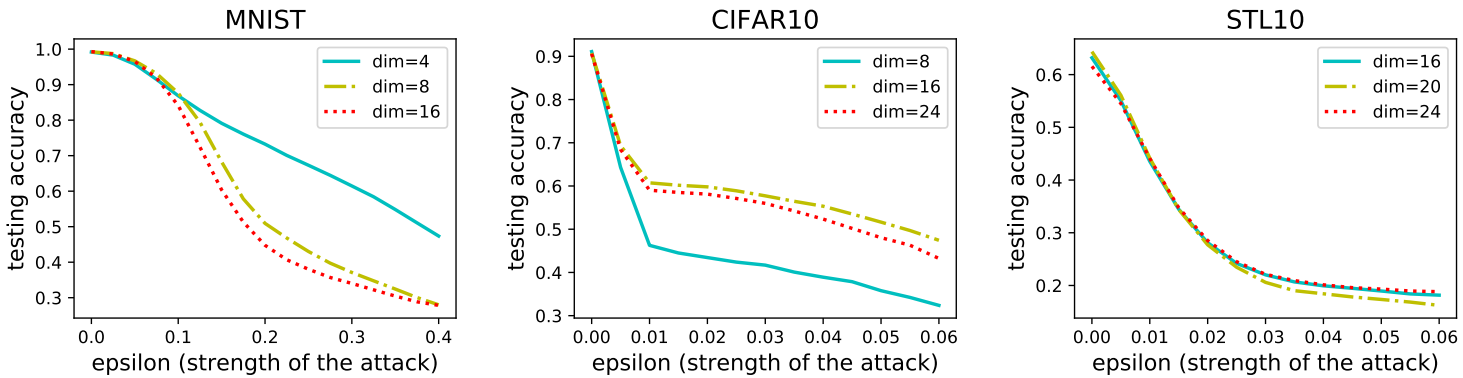

Figure: Testing accuracy of models with different embedding dimensions under ℓ_∞-PGD attack.

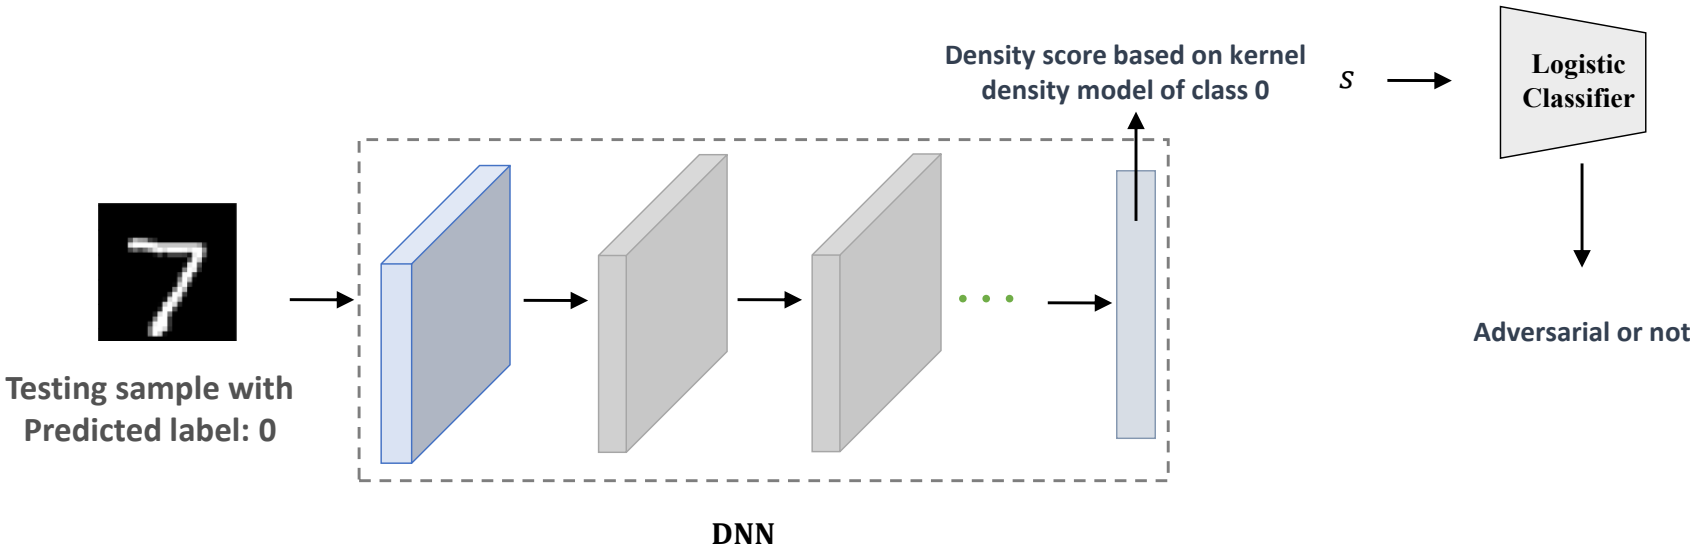
Data	Data dim.	Estimated Intrinsic dim.	Embedding dim.
MNIST	$1 \times 28 \times 28$	13	4
CIFAR10	$3 \times 32 \times 32$	17	16
STL10	$3 \times 96 \times 96$	20	16
Tiny Imagenet	$3 \times 64 \times 64$	19	20

Table: Pixel space dimension, intrinsic dimension estimated by the method proposed by Levina et al., and final embedding dimension used.

Detection

KD adversarial detection



- **KD Adversarial Detection:** Feinman et al. proposed to detect adversarial examples by performing Kernel Density (KD) estimation in the subspace of deep classifier.

Feinman et al. *Detecting Adversarial Samples from Artifacts.* ICML, 2017.

Bayesian Adversarial Detector (BATer)

Observation 1

Tanay et al., 2016: Adversarial samples do not lie on the data manifold.

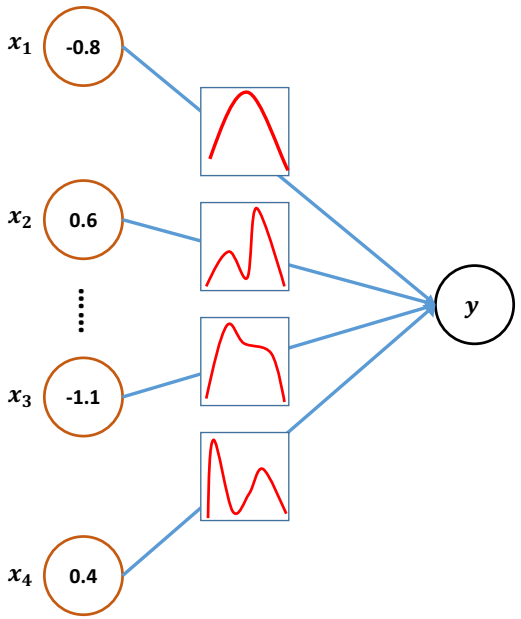
Observation 2

A randomized network can lead to a distribution of hidden features, making it easier for detecting an out-of-manifold example.

- Our approach: detecting adversarial examples with Bayesian neural network
  - Bayesian neural network
  - Hidden output distributional differences

Li et al. *Detecting Adversarial Examples with Bayesian Neural Network.* 2021.

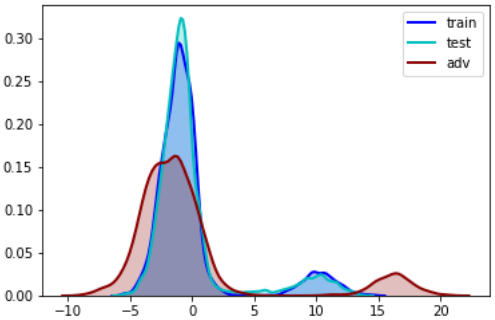
Bayesian Neural Network (BNN)



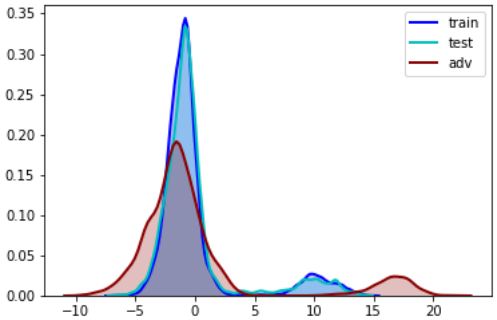
- All weights are represented by probability distributions over possible values
- BNN: a probabilistic model $p(y|\boldsymbol{x}, \boldsymbol{w})$

(Blundell et al., 2015)

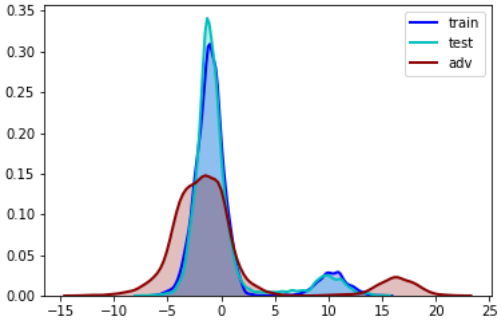
Why BNN not DNN?



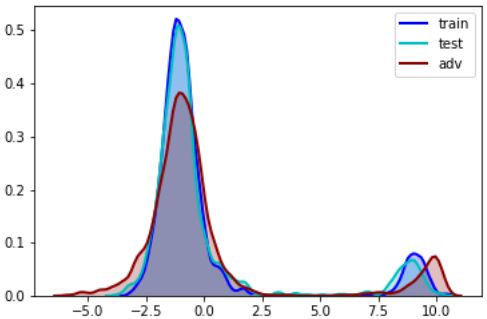
(a) BNN: Layer 23



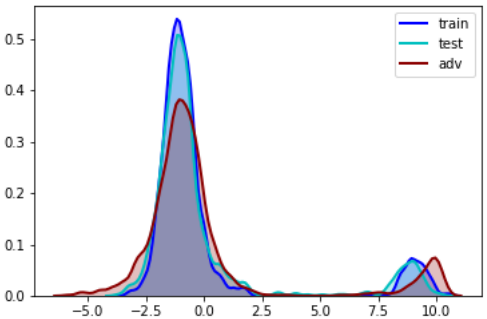
(b) BNN: Layer 33



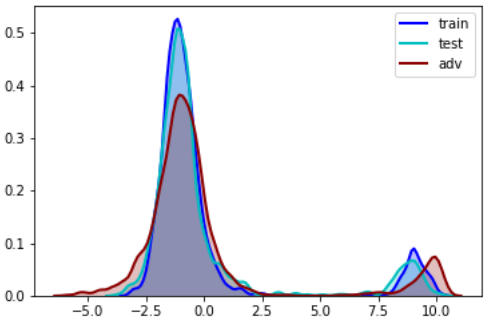
(c) BNN: Layer 43



(d) DNN: Layer 23



(e) DNN: Layer 33



(f) DNN: Layer 43

Figure: Hidden Layer Output Distributions (HODs) of BNN on automobile class of CIFAR10. train: HODs of training examples from automobile class. test: HODs of test examples from automobile class. adv: HODs of adversarial examples predicted as automobile. The adversarial examples are generated by PGD.

BATer: Framework

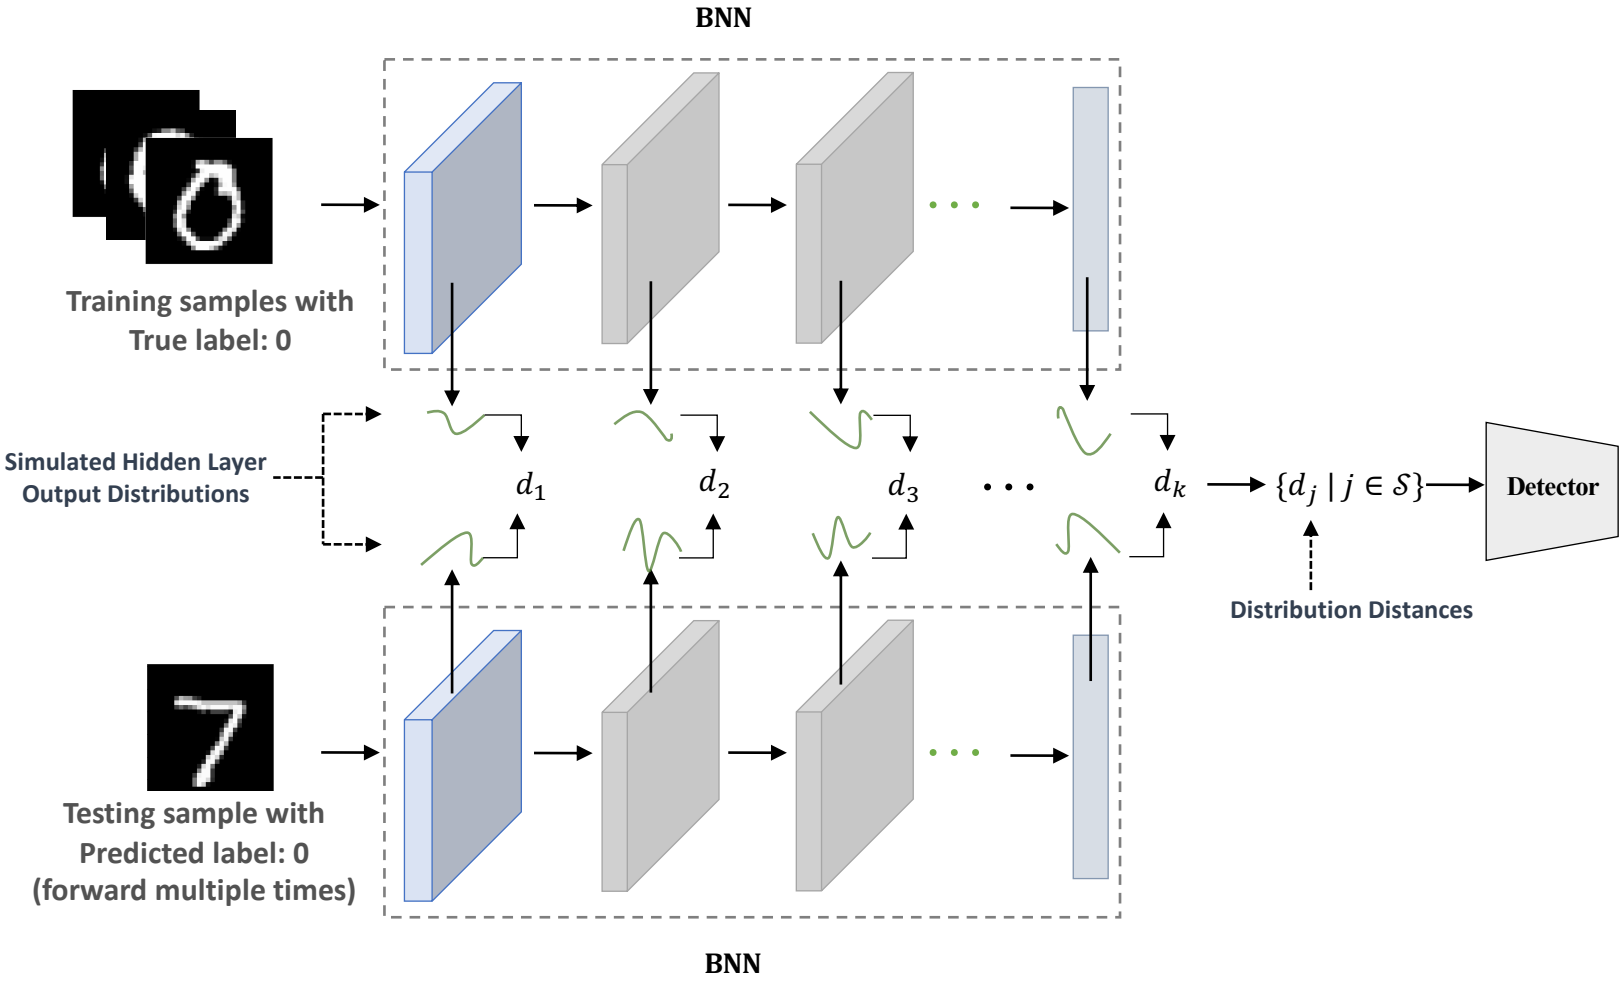


Figure: Framework of BATER. k is the total number of hidden layers. d_j represents the distribution distance measured from j-th hidden layer. $\mathcal{S}$ is the index set of selected hidden layers.

BATer: Methods Compared

1. **KD**: R. Feinman, R. R. Curtin, S. Shintre, and A. B. Gardner. *Detecting adversarial samples from artifacts.* ICML, 2017
2. **LID**: X. Ma, B. Li, Y. Wang, S. M. Erfani, S. Wijewickrema, G. Schoenebeck, D. Song, M. E. Houle, andJ. Bailey. *Characterizing adversarial subspaces using local intrinsic dimensionality.* ICLR, 2018.
3. **ODD**: K. Roth, Y. Kilcher, and T. Hofmann. *The odds are odd: A statistical test for detecting adversarial examples.* ICML, 2019.
4. **ReBeL**: Raghuram, Jayaram, et al. *A General Framework For Detecting Anomalous Inputs to DNN Classifiers.* ICML, 2021.
5. **BATer**: Our proposed method

BATer: Comparison With Other Methods

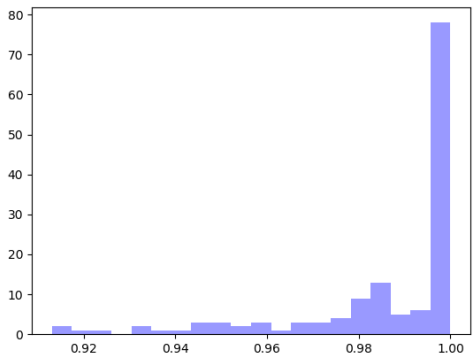
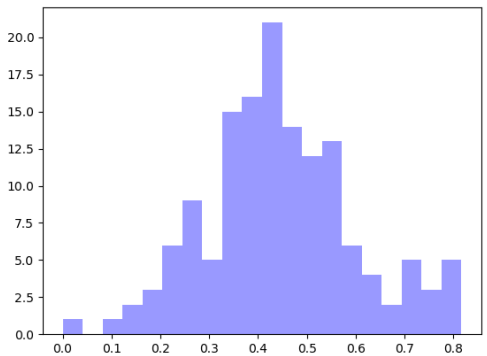
class9	0.915	0.493	0.959	0.874
lass10	0.949	0.567	0.982	0.917

Table: AUC of BATER with different structures (BNN vs. DNN) on CIFAR10 and MNIST of different classes.



(a) AUC of BNN



(b) AUC of DNN

Figure: AUC Histograms of BATER with different structures (BNN vs. DNN) on Imagenet-sub.

High Confidence Attack

- Athalye et al.: detection methods can fail when the confidence level of adversarial examples generated by C&W attack increases.

Data	Metric	C&W (Confidence)		
		0	10	20
CIFAR10	AUC	0.980	0.999	0.995
	TPR(FPR@0.01)	0.606	0.998	0.939
	TPR(FPR@0.05)	0.881	1.000	0.995
	TPR(FPR@0.10)	0.965	1.000	0.995
MNIST	AUC	0.999	0.995	0.995
	TPR(FPR@0.01)	0.974	0.913	0.919
	TPR(FPR@0.05)	0.997	0.993	0.994
	TPR(FPR@0.10)	1.000	0.998	0.999
Imagenet -sub	AUC	0.928	0.991	0.983
	TPR(FPR@0.01)	0.146	0.896	0.642
	TPR(FPR@0.05)	0.538	0.951	0.910
	TPR(FPR@0.10)	0.815	0.977	0.964

Table: Performance of BATER against high-confidence C&W.

NLP

Conclusions

- Different types of adversarial defense
